

Internship Workflow Management System (IWMS)	
Configuration and Change Management Report	Date: 11/04/2026

This report details the Configuration and Change Management (CCM) strategies implemented for the **Internship Workflow Management System (IWMS)** project. It outlines the procedures for version control, artifact management, and the systematic handling of modifications to ensure project integrity throughout the development lifecycle

The primary objectives of the CCM process are:

- To maintain a consistent set of work products (code, documentation, and models) as they evolve.
- To ensure consistent and reproducible software builds.
- To provide an efficient mechanism for adapting to changes and technical issues while re-planning work as necessary.
- To provide data and audit trails for measuring project progress.

The purpose of this discipline is to maintain a consistent set of work products as they evolve. Furthermore, it aims to maintain consistent builds of the software, provide an efficient means to adapt to changes and issues, and re-plan work accordingly. Finally, it is designed to provide data for measuring progress.

Configuration and Change Management Specifications In many organizations, the term "configuration management" implies all of these things. Within the context of this process, configuration management refers to the ability to maintain versions of artifacts and consistent configurations of artifacts, addressing the first two objectives listed above. Change Management refers to the process of managing changes to configuration-controlled artifacts, addressing the latter two objectives listed above.

Although it is important to keep up-to-date versions and configurations of all work products, the primary work products of concern are the Artifact: Implementation and the Artifact: Build.

Based on Figure 25.1, our specific configuration management activities include:

- **Version Management:** Controlling individual **Component Versions** (e.g., source code, Dockerfiles) and integrating them into overarching **System Versions**.
- **System Building:** Assembling approved **Component Versions** into executable systems.
- **Release Management:** Transitioning stable **System Versions** into official **System Releases**.
- **Change Management:** Systematically handling **Change Proposals** to modify the system or its components.

Changes are managed via the Task: Request Change and subsequent prioritization and disposition of change requests via the Artifact: Work Items List. The workflow for handling any

Internship Workflow Management System (IWMS)	
Configuration and Change Management Report	Date: 11/04/2026

modification strictly adheres to the following change management process flowchart:

1. **Original Change Request:** A new requirement, bug report, or modification is identified and logged.
2. **Approve the Concept:** The team evaluates the initial request. If rejected or postponed, it is routed to *Inactive Requests with Notes*.
3. **Analysis of Change:** The technical impact is assessed. The concept may be *Modified* and sent back for re-approval during this stage.
4. **Approve to Proceed:** The team authorizes the implementation of the analyzed change. If rejected, it becomes an inactive request.
5. **Implementation and Testing:** The developer executes the code changes and performs local testing. The implementation may be *Modified* iteratively until it passes tests.
6. **Approve the Resolution:** The completed code is reviewed. If accepted, it moves forward; if rejected, it becomes an inactive request.
7. **Addition to Planned Development:** The successfully resolved change is officially merged into the project baseline.

This discipline spans the entire lifecycle, and every other discipline relies upon the configuration and change management discipline to maintain a consistent, up-to-date, set of work products -- and to prioritize and track changes to those work products -- throughout the lifecycle.

Configuration and change management is performed by everyone on the development team.

Because of the importance and pervasiveness of this discipline, configuration and change management guidance is associated with tasks and work products in all other disciplines.

4 Key Considerations

The development of the **Internship Workflow Management System (IWMS)** strictly utilizes **GitLab** as its central Configuration Management System (CMS). This platform is the primary environment for maintaining the versioning and configuration information of all project artifacts, including backend services, frontend components, and deployment scripts. Given the collaborative nature of this engineering project, a robust CMS is not optional; without it, maintaining a consistent software build would be virtually impossible.

+4

4.1. Collaborative Development via GitLab

To ensure high-quality contributions and maintain the integrity of the project baseline, we implemented a structured branching and review strategy:

- **Merge Request (MR) Workflow:** All feature developments and bug fixes are performed on isolated branches. Once a task is completed, a **Merge Request (MR)** is initiated to integrate the changes into the main development branch.

4.2. Conflict Resolution and System Integrity

A critical aspect of our configuration management is the systematic handling of technical friction:

- **Handling Merge Conflicts:** In a concurrent development environment, multiple changes

Internship Workflow Management System (IWMS)	
Configuration and Change Management Report	Date: 11/04/2026

to the same artifact often lead to **merge conflicts**. Our process requires developers to resolve these conflicts locally, ensuring that the final integrated code is functional and consistent before it reaches the final review stage.

- **Version Control for Artifacts:** GitLab allows us to track every iteration of our core components, such as Dockerfiles and Spring Boot source files. This provides an essential audit trail for measuring project progress and identifying the root cause of any technical issues.

4.3. Necessity for Project Lifecycle

This discipline spans the entire development lifecycle, as every other task relies on the configuration and change management discipline to maintain an up-to-date set of work products. We eliminate the risks of data loss and inconsistent builds that would otherwise paralyze the project

5. Traceability Table

Change Request ID / Feature	Description (Analysis of Change)	Branch Name	Commit Hash	Status (Approve Resolution)
CR-001	Complete login logic	infinite-runtime/Kerm	33152c61e928adf81165b9c0521f02420fd65978	Approve to Proceed (In Progress)

					missing signatures.		6 09:30
51	Backend	REST API	UC-007	Cursor	How do you implement a GET /api/coordinator/submissions endpoint that returns pending submissions list? Include filters and sorting.	Spring Boot	08 Apr 2026 10:00
52	Backend	REST API	UC-007	ChatGPT	How do you implement a GET /api/coordinator/submissions/{submissionId} endpoint to return detailed submission view?	Spring Boot	08 Apr 2026 10:30
53	Backend	REST API	UC-007	Gemini	How do you implement a PUT /api/coordinator/submissions/{submissionId}/status endpoint for coordinator to update status? Handle approved/rejected/revision-required.	Spring Boot	08 Apr 2026 11:00
54	Backend	REST API	UC-007	Cursor	How do you implement a POST /api/coordinator/submissions/{submissionId}/revision endpoint to set revision required status with new deadline?	Spring Boot	08 Apr 2026 11:30
55	Backend	Events	UC-007	ChatGPT	How do you send student email notifications when status is updated? Include feedback message from coordinator.	Spring Boot	08 Apr 2026 12:00
56	Backend	CSV Processing	UC-007	Gemini	How do you implement a CSV parser for coordinators to upload student lists? Include data validation.	Spring Boot	08 Apr 2026 12:30
57	Backend	Aggregation	UC-007	Cursor	How do you write aggregation queries to calculate compliance statistics? Count approved/rejected/pending submissions.	Spring Boot	08 Apr 2026 13:00
58	Backend	Audit Logging	UC-007	ChatGPT	How do you log coordinator actions (status change, feedback) to audit logs? Use @Audit annotation.	Spring Boot	08 Apr 2026
